LIPID PROFILE

Triglycerids	65	mg%	70 - 190
S. Cholesterol S.	187	mg%	130 - 230
S. HDL Cholesterol	42.1	mg%	35 - 75
S. LDL Cholesterol	131.9	mg%	75 - 150
VLDL	13	mg%	0 - 34
Chol / HDL factor	4.44		
LDL / HDL Factor	3.13		

COMMENTS

- * Triglycerides (TG) are the main dietary lipids. Cholesterol constitutes a small part of the dietary lipids, it is mostly synthesised in the liver. Both TG and Chol. are transported through the plasma by lipoproteins (Chylomicrons, VLDL, LDL, IDL, HDL).
- * LDL is the major cholesterol particle in plasma and high levels are strongly implicated in the formation of atheroma. An increase in the LDL leads to hypercholesterolemia, and therefore a risk factor for IHD. LDL increases with age particularly in females. Oestrogen lower LDL and raise HDL. Raised chol. in females is mostly due to disturbed thyroid function.
- * Increase in VLDL leads to hyperglyceridaemia. Raised TGs are associated with increased risk of CHD. Very high TGs increase the risk of Pancreatitis. Cholesterol is often raised due to Diabetes, Renal disease, Diuretic or Betablocker therapy.

TYPES OF HYPERLIPOPROTEINEMIAS

TYPE 1: Normal cholesterol TG greatly raised	TYPE 3: Cholesterol increased TG increased
TYPE 2a: Cholesterol increased LDL increased TG normal	TYPE 4: Cholesterol normal /increased VLDL increased TG increased
TYPE 2b Chol. increased VLDL raised TG increased LDL increased	TYPE 5: Cholesterol increased LDL reduced VLDL increased TG greatly increased

- PSA is a reliable Tumor Marker for already diagnosed Prostatic Carcinomas .Though present in many tissues including breast, salivary glands etc.,
- PSA production is the glandular epithelium of the prostate gland. PSA is,therefore,remarkably specific for the prostate.
- Baseline levels measured prior to therapeutic intervention and followed later by serial, periodical measurements will predict the outcome of the therapy. It also helps in early discovery of recurrences, relapses and metastases.
- In general, Tumour Marker levels are directly related to the tumour mass and the stage of the cancer.
- However, it is the rate of change of the tumour marker level which is more important, rather than its absolute value. A 50 % change may be considered clinically significant.
- It must be emphasized that PSA may also be elevated in Benign Prostatic Hyperplasia and Inflammatory conditions of the surrounding Genito-Urinary Tract.
- PSA may be done along with Free PSA that provides additional information

GOOD CONTROL: 6.0 to 7.0
FAIR CONTROLLED 7.0 AND 8.0
UNCONTROLLED 8.0 AND ABOVE

Glycosylated haemoglobin is the adducted glucose in the haemoglobin of the red blood cells, this adduction is stable for the life time of the RBC (i.e 120 days). There fore the measure of glycosylated haemoglobin reflects the average blood glucose concentration over the preseding several weeks. The sudden change in blood glucose level would not effect the glycosylated haemoglobin level ,which serves as a better marker of long term metabolic control and the efficacy of therapy.
