Non diabetic adults >=18 years		4.0 - 6.0	
At risk		>=6.0 to <= 6.5	
Diagnosing Diabetes		> 6.5	
Therapeutic goals for glycemic Control		Age > 19 years Goal of therapy: <7.0 Action suggested: >8.0	
		Age < 19 years Goal of therapy: <7.5	
Note: 1. Since HbA1c reflects long term fluctuations in the blood glucose concentration, a diabetic patient who is recently under good control may still have a high concentration of HbA1c. Converse is true for a diabetic previously under good control but now poorly

controlled.

2.Target goals of <7.0% may be beneficial in patients with short

duration of diabetes, long life expectancy and no significant cardiovascular disease. In patients with significant complications

of diabetes, limited life expectancy or extensive co-morbid conditions

targeting a goal of <7.0% may not be appropriate.

Comments

HbA1c provides an index of average blood glucose levels over the past

8-12 weeks and is a much better indicator of long term glycemic control

as compared to blood and urinary glucose determinations.

PSA (Serum)

<u>TEST NAME</u>	<u>RESULT</u>	<u>NORMAL RANGES</u>
<u>PSA</u>	0.43	<u>< 4.0 ng/ml</u>

METHOD:- Two step enzyme immunoassay sandwich method with final fluorescent detection (ELFA)

REMARKS:-

- 1- PSA is elevated in benign prostatic hyperplasia (BPH). Clinically an elevated PSA value is not of diagnostic value as a specific test for cancer and should only be used in conjunction with other clinical manifestations (observations) and diagnostic procedures such as prostate biopsy and DRE (Digital Rectal Examination) report.
- 2- Free PSA determinations may be helpful in regards to the differential diagnosis of BPH and prostate cancer conditions.
- 3- PSA level in man increases as their age advances. Hence the requirement of age-specific values is a must.
