Sample Type : EDTA whole blood	Sample ID : 243606	Report : 10-Mar-2024 11.14

TEST NAME	RESULT	UNIT	RANGE	METHOD
-----------	--------	------	-------	--------

HEAMATOLOGY				
HBA1C (GLYCOSYLATED HB)	5.3	%	4-6	PEIT
Metabolically healthy patients	4.5 - 6.0 %		Good control :	
	6.1 - 6.5 %			
Fair control :	6.6 - 7.0 %			
Poor control :	Above - >7.0 %			

COMMENTS: HbA1c is an indicator of glycemic control. HbA1c represents average glycemia over the past six to eight weeks. Glycation of hemoglobin occurs over the entire 120 day life span of the red blood cell, but with in this 120 days.Recent glycemia has the largest influence on the HbA1c value. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four. Estimated Average Glucose mg/dl = (HbA1c x 35.6) + 77.3) Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only this means that to predict or estimate average glucose from Hb-A1c or vice-versa is not "perfect" but gives a good working ballpark estimate. Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime glucose levels, which are easier to predict and control. As per IFCC recommendations 2007, HbA1c being reported as above maintaining traceability to both IFCC (mmol/mol) & NGSP (%) units.

TEST NAME	RESULT	UNIT	RANGE	METHOD
HbsAg	NEGATIVE	Serology		Immunochromatography

Interpretation:-

Clinical Significance:- Hepatitis B surface antigen (HBsAg) is a test to determine if some one is infected with hepatitis B virus .A Positive or reactive HBsAg test result means that the person is infected and further testing is needed to determine . if this is a new " acute " infection or "chronic" infection.

HBsAg usually appearance 4 weeks after exposure but can be detected any time after 1st week .

HIV 1 & II	NEGATIVE			Immunochromatography
------------	----------	--	--	----------------------

Serology

Clinical Significance : HIV tests look for antibodies to HIV (Immunodeficient virus) in blood or all fluid approx 97% people develop detectable antibodies within 3-12 weeks(21 -84 days) of infection immunoassay are rapid tests used for screening positive rapid tests need a follow up confirm and includes western blot test.Rapid test performed during window period may give and thus detect HIV at about 10 days after infection even before antibodies develop but these are not used as a screening test.

Second trimester	0.2 - 3*			
Third trimester	0.3 - 3*			

COMMENTS: Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal. Results are invalidated if the client has undergone a radionuclide scan within 7-14 days before the test. Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved. The production, circulation, and disintegration of thyroid hormones are altered throughout the stages of pregnancy

ULTRASOUND WHOLE ABDOMEN

Convex and linear probes were used.

The liver is normal in size however is increased in echotexture. Intrahepatic bile ducts and CBD are not dilated. Hepatic portal veins and the IVC appear normal in calibre.

Gall bladder is adequately distended with normal intraluminal fluid contents. No evidence of calculus / wall thickness noted.

Pancreas is of normal size and contour with normal echotexture.

Right kidney is normal in size and position. It shows normal movements with respiration. Cortical thickness is normal.

No calculus, mass or hydronephrotic changes seen.

Right kidney measures- 97 x 50mm.

Renal artery pulsation appears normal.

Left kidney is normal in size and position. It shows normal movements with respiration. Cortical thickness is normal.

No calculus, mass or hydronephrotic changes seen.

Left kidney measures- 90 x 49mm.

Renal artery pulsation appears normal.

Referred By	: Dr. .	Mobile No.	: 7015939715

Spleen is of normal size and shape. Echotexture is normal. No focal lesion is seen.
Retro-peritoneal lymphadenopathy/ ascites/ pleural effusion:

Urinary bladder does not show any calculus or mass lesion. No significant wall thickening noted.

Prostate is increased in size for age with median lobe hypertrophy indenting the base of bladder. The echotexture is coarsened. It measures 37 x 45 x 42mm. Its volume is 38gms. Corpora amylosia calcification is seen.

Impression -1)Fatty liver Grade I.
2)Prostatomegaly.
