**HbA1c** (Specimen : EDTA)

Date	Status	01/Apr/24 02:34PM	Unit	Bio Ref Interval
HbA1c		5.0	%	<5.7
AVERAGE BLOOD SUGAR		97.0	MG/DL	<117

**Interpretation :**

**HbA1c :**

Hba1c:

As per American Diabetes Association (ADA)	
Reference Group	HbA1c in %
Non-diabetic adults	<5.7%
Pre-diabetic	5.7-6.4 %
Diabetic	>or = 6.5%
ADA Target	>7.0
Action suggested	>8.0

Glycation is nonenzymatic addition of sugar residue to amino groups of proteins. HbA1C is formed by condensation of glucose with n-terminal valine residue of each beta chain of hb a to form an unstable schiff base. It is the major fraction, constituting approximately 80% of HbA1. Formation of glycated hemoglobin (GHb) is essentially irreversible and the concentration in the blood depends on both the lifespan of red blood cells(120 days) and the blood glucose concentration. the GHb concentration represents the integrated values for glucose over a period of 6 to 8 weeks. GHb values are free of day to day glucose fluctuations and are unaffected by recent exercise or food ingestion. Concentration of plasma glucose concentration in GHb depends on the time interval, with the most recent values providing a larger contribution than earlier values. The interpretation of GHb depends on RBC having normal life span. Patients with hemolytic disease or other conditions with shortened RBC survival exhibit a substantial reduction of GHb. High GHb is been reported in iron deficiency anaemia.

Very High		>=500	>=190	>=220

**Note:**

1. Measurements in the same patient can show physiological & analytical variations. Three serial samples 1 week apart are recommended for Total Cholesterol, Triglycerides, HDL & LDL Cholesterol.
2. As per NLA-2014 guidelines, all adults above the age of 20 years should be screened for lipid status. Selective screening of children above the age of 2 years with a family history of premature cardiovascular disease or those with at least one parent with high total cholesterol is recommended.
3. Low HDL levels are associated with increased risk for Atherosclerotic Cardiovascular disease (ASCVD) due to insufficient HDL being available to participate in reverse cholesterol transport, the process by which cholesterol is eliminated from peripheral tissues.
4. NLA-2014 identifies Non HDL Cholesterol (an indicator of all atherogenic lipoproteins such as LDL, VLDL, IDL, Lp(a), Chylomicron remnants) along with LDL-cholesterol as co-primary target for cholesterol lowering therapy. Note that major risk factors can modify treatment goals for LDL & Non HDL.

## DEPARTMENT OF RADIOLOGY

### USG BOTH BREAST

*Ultrasound breast has been performed using High frequency probe.*

*Few prominent ducts are seen in subareolar region (physiological lactational status).*

Both Breasts reveal normal parenchymal echogenicity with both fatty and glandular tissues. There is no evidence of any focal abnormal lesion.

Nipple-areolar complex appears normal bilaterally.

Visualised axillary tail region appears normal bilaterally.

No focal lesion is noted in the axillary region bilaterally.

Underlying pectoralis region appears normal.

#### IMPRESSION:

- NO SIGNIFICANT ABNORMALITY.

Please correlate clinically

### USG WHOLE ABDOMEN

**Liver is enlarged in size (17.7cm)**, normal in shape and echotexture. No focal SOL noted. Vascular channels are clear. No evidence of IHBR dilatation.

**Gall Bladder is not seen- Post operative.** CBD & PV are normal.

**Spleen** is normal in size, shape and echotexture, measures 9.3cm.

**Pancreatic** head appears normal, Rest of the pancreas is obscured by bowel gas shadows.

**Both Kidneys** are normal in size, shape, position & echogenicity. CMD is maintained. No evidence of calculus or hydronephrosis.

**Right kidney** – 10.8 x 4.6cm

**Left kidney** – 11.7 x 4.2cm

**Urinary Bladder** is partially distended and grossly normal.

**Uterus** is normal in size, shape and echotexture. No focal lesion noted. Endometrial echo is normal (7.3mm). Cervix is normal.

**Both adnexa** are clear.

No free fluid noted in peritoneal cavity.
