Blood Group ABO & RH Factor

Blood Group (EDTA whole blood & Serum, Forward and Reverse By Tube Method)	"B"	
RH Factor	Positive	

Methodology

This is done by forward and reverse grouping by tube Agglutination method.

Interpretation

Newborn baby does not produce ABO antibodies until 3 to 6 months of age. So the blood group of the Newborn baby is done by ABO antigen grouping (forward grouping) only, antibody grouping (reverse grouping) is not required. Confirmation of the New-born's blood group is indicated when the A and B antigen expression and the isoagglutinins are fully developed (2–4 years).

X-RAY CHEST PA VIEW

Both lung fields show equal translucency and vasculature.

Pleural spaces are clear.

The cardiac size is normal.

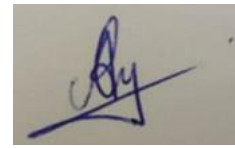

The domes of diaphragm are normal in position & show smooth outline.

The bony parts are normal.

Impression:

- **No obvious significant abnormality is seen.**

Suggest: Clinical correlation.

Dr. Abhishek Yadav
Consultant Radiologist

Note: Investigations have their limitations. Solitary radiological investigations never confirm the final diagnosis. They only help in diagnosing the disease in correlation to clinical symptoms and other related tests. X-ray is known to have inter-observer variations. Further/ follow up imaging may be needed in some cases for confirmation/ exclusion of diagnosis. Not all fractures may be visible in given X-ray views; hence a clinical correlation is suggested in cases of injury with swelling and restricted movements. Please interpret accordingly.
