HbA1c is an indicator of glycemic control. HbA1c represent average glycemia over the past six to eight weeks.

Glycation of hemoglobin occurs the entire 120 days life span of the red blood cell, but with in this 120 days.

Recent glycemia has the largest influence on the HbA1c value.

Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months 2-4.
