ESR	43	< 20 mm at the end of 1Hr.	WESTERGREN
<p>INTERPRETATION ESR(Erythrocyte Sedimentation Rate)-The ESR measures the time required for erythrocytes from a whole blood sample to settle to the bottom of a vertical tube. Factors influencing the ESR include red cell volume, surface area, density, aggregation, and surface charge. The ESR is a sensitive, but nonspecific test that is frequently the earliest indicator of disease. It often rises significantly in widespread inflammatory disorders due to infection or autoimmune mechanisms. Such elevations may be prolonged in localized inflammation and malignancies. Increased ESR: may indicate pregnancy, acute or chronic inflammation, tuberculosis, rheumatic fever, paraproteinemias, rheumatoid arthritis, some malignancies, or anemia. Decreased ESR: may indicate polycythemia, sickle cell anemia, hyperviscosity, or low plasma protein.</p>

Thyroid Profile - Total T3, Total T4, TSH (TFT)

1	Total T3 Serum, Method: CLIA	97.74	ng/dL	60 - 200
2	Total T4 Serum, Method: CLIA	7.35	µg/dL	4.5 - 14.5
3	TSH (Thyroid Stimulating Hormone) Serum, Method: CLIA	2.117	µIU/ml	0.35 - 5.5

Interpretation

- Triiodothyronine (T3) is produced by the thyroid gland and along with thyroxine (T4) help control the rate at which the body uses energy. Elevated T3 denote hyperthyroidism while low levels indicate hypothyroidism.
- The most common causes of thyroid dysfunction are related to autoimmune disorders. Graves disease causes hyperthyroidism, but it can also be caused by thyroiditis, thyroid cancer, and excessive production of TSH. Total T3 is used to assess thyroid function.
- Elevated T4 levels may indicate hyperthyroidism. They may also indicate other thyroid problems, such as thyroiditis or toxic multinodular goiter. Abnormally low levels of T4 may indicate: dietary issues, such as fasting, malnutrition, or an iodine deficiency, medications that affect protein levels, hypothyroidism, illness.
- Thyroid-stimulating hormone (TSH) stimulates the production and release of T4 (primarily) and T3. They help control the rate at which the body uses energy and are regulated by a feedback system. Most of the T4 circulates in the blood bound to protein, while a small percentage is free (not bound).
- Lab has estimated Total T4 reference intervals that are specific for India, using the indirect sampling technique following CLSI EP28-A3c document: Defining Establishing, and Verifying Reference Intervals in the Clinical Laboratory: Approved Guideline-Third Edition.
- Thyroid hormone status during pregnancy:

Pregnancy stage	TSH (µIU/ml)	T3 (ng/dl)	T4 (µg/dL)
First trimester	0.05-3.70	71-175	6.5-10.1
Second trimester	0.31-4.35	91-195	7.5-10.3
Third trimester	0.41-5.18	104-182	6.3-9.7

HbA1c (Whole Blood)

1	HbA1c-Glycated Haemoglobin EDTA Whole Blood, Method: HPLC	5.4	%	Non-diabetic: 4-6 Excellent Control: 6-7 Fair to good control: 7-8 Unsatisfactory control: 8-10 Poor Control: >10
2	Estimated Average Glucose (eAG) EDTA Whole Blood, Method: Calculated	108.28	mg/dL	90-120 mg/dL : Good control 121-150 mg/dL : Fair control 151-180 mg/dL : Unsatisfactory control >180 mg/dL : Poor control

Interpretation

- The term HbA1c refers to Glycated Haemoglobin. Measuring HbA1c gives an overall picture of what the average blood sugar levels have been over a period of weeks/month. Higher the HbA1c, the greater the risk of developing diabetes-related complications.
- HbA1c has been endorsed by clinical groups and ADA (American Diabetes Association) guidelines 2012, for the diagnosis of diabetes using a cut-off point of 6.5%. ADA defined biological reference range for HbA1c is between 4-6%. Patients with HbA1c value between 6.0-6.5% are considered at risk for developing diabetes in the future. Trends in HbA1c area a better indicator of glucose control than standalone test.
- To estimate the eAG from the HbA1c value, the following equation is used: $eAG(mg/dl) = 28.7 * A1c - 46.7$.
- Diabetic must aspire to keep values under 7% to avoid the various complications resulting from diabetes.
