NAME: Amjali Devi C.

AGE/ GENDER: 45/F

HEIGHT: 153 cm

WEIGHT: 90.2 kg

IDENTIFICATION MARK: —

BLOOD PRESSURE: 131/89

PULSE: 89

CVS: Normal

RS:P

ANY OTHER DISEASE DIAGNOSED IN THE PAST: Diabetic Metformin glim.

ALLERGIES, IF ANY: Nil 1 mg.

LIST OF PRESCRIBED MEDICINES: Nil

ANY OTHER REMARKS: Nil

I Certify that I have carefully examined Mr/Mrs. Amjali Devi C. son/daughter of Ms G. chinnapa who has signed in my presence. He/ she has no physical disease and is fit for employment.

Signature of candidate

Dr. BINDIRAJ. R

Internal Medicine
Signature of Medical Officer

Place: Spectrum Diagnostic health care

Date: 23/02/24

Disclaimer: The patient has not been checked for COVID. This certificate does not relate to the covid status of the patient examined

Bill Date : 23-Feb-2024 08:59 AM
Sample Col. Date : 23-Feb-2024 08:59 AM
Result Date : 23-Feb-2024 12:34 PM
Report Status : Final

Test Name	Result	Unit	Reference Value	Method
Fasting Urine Glucose-Urine	Negative		Negative	Dipstick/Benedicts (Manual)
Glycosylated Haemoglobin (HbA1c)-Whole Blood EDTA	5.80	%	Non diabetic adults : <5.7 At risk (Prediabetes) : 5.7 - 6.4 Diagnosing Diabetes >= 6.5 Diabetes Excellent Control : 6-7 Fair to good Control : 7-8 Unsatisfactory Control : 8-10 Poor Control : >10	HPLC
Estimated Average Glucose(eAG)	119.76	mg/dL		Calculated

Note: 1. Since HbA1c reflects long term fluctuations in the blood glucose concentration, a diabetic patient who is recently under good control may still have a high concentration of HbA1c. Converse is true for a diabetic previously under good control but now poorly controlled.

2. Target goals of < 7.0 % may be beneficial in patients with short duration of diabetes, long life expectancy and no significant cardiovascular disease. In patients with significant complications of diabetes, limited life expectancy or extensive co-morbid conditions, targeting a goal of < 7.0 % may not be appropriate.

Comments: HbA1c provides an index of average blood glucose levels over the past 8 - 12 weeks and is a much better indicator of long term glycaemic control as compared to blood and urinary glucose determinations.

Ref. By Dr.	: Dr. APOLO CLINIC			Result Date	: 23-Feb-2024 12:34 PM
Reg. No.	: 2302240012			Report Status	: Final
C/o	: Apollo Clinic				

Test Name	Result	Unit	Reference Value	Method
Lipid Profile-Serum				
Cholesterol Total-Serum	131.00	mg/dL	Female: 0.0 - 200	Cholesterol Oxidase/Peroxidase
Triglycerides-Serum	143.00	mg/dL	Female: 0.0 - 150	Lipase/Glycerol Dehydrogenase
High-density lipoprotein (HDL) Cholesterol-Serum	41.00	mg/dL	Female: 40.0 - 60.0	Accelerator/Selective Detergent
Non-HDL cholesterol-Serum	90	mg/dL	Female: 0.0 - 130	Calculated
Low-density lipoprotein (LDL) Cholesterol-Serum	75.00	mg/dL	Female: 0.0 - 100.0	Cholesterol esterase and cholesterol oxidase
Very-low-density lipoprotein (VLDL) cholesterol-Serum	29	mg/dL	Female: 0.0 - 40	Calculated
Cholesterol/HDL Ratio-Serum	3.20	Ratio	Female: 0.0 - 5.0	Calculated

Interpretation:

Parameter	Desirable	Borderline High	High	Very High
Total Cholesterol	<200	200-239	>240	
Triglycerides	<150	150-199	200-499	>500
Non-HDL cholesterol	<130	160-189	190-219	>320
Low-density lipoprotein (LDL) Cholesterol	<100	100-129	160-189	>190

Comments: As per Lipid Association of India (LAI), for routine screening, overnight fasting preferred but not mandatory. Indians are at very high risk of developing Atherosclerotic Cardiovascular (ASCVD). Among the various risk factors for ASCVD such as dyslipidemia, Diabetes Mellitus, sedentary lifestyle, Hypertension, smoking etc., dyslipidemia has the highest population attributable risk for MI both because of direct association with disease pathogenesis and very high prevalence in Indian population. Hence monitoring lipid profile regularly for effective management with dyslipidemia remains one of the most important healthcare targets for prevention of ASCVD. In addition, estimation of ASCVD risk is an essential, initial step in the management of individuals requiring primary prevention of ASCVD. In the context of lipid management, such a risk estimate forms the basis for several key therapeutic decisions, such as the need for and aggressiveness of statin therapy.

Name	: MRS. ANJALI DEVI C	UHID	: 2302240012	Bill Date	: 23-Feb-2024 08:59 AM
Age / Gender	: 45 years / Female			Sample Col. Date	: 23-Feb-2024 08:59 AM
Ref. By Dr.	: Dr. APOLO CLINIC			Result Date	: 23-Feb-2024 12:34 PM
Reg. No.	: 2302240012			Report Status	: Final
C/o	: Apollo Clinic				

Test Name	Result	Unit	Reference Value	Method
Calcium, Total- Serum	9.30	mg/dL	8.50-10.10	Spectrophotometry (O-Cresolphthalein complexone)
Gamma-Glutamyl Transferase (GGT)-Serum	17.00	U/L	Male: 15.0-85.0 Female: 5.0-55.0	Other g-Glut-3-carboxy-4 nitro

Comments: Gamma-glutamyltransferase (GGT) is primarily present in kidney, liver, and pancreatic cells. Small amounts are present in other tissues. Even though renal tissue has the highest level of GGT, the enzyme present in the serum appears to originate primarily from the hepatobiliary system, and GGT activity is elevated in any and all forms of liver disease. It is highest in cases of intra- or posthepatic biliary obstruction, reaching levels some 5 to 30 times normal. GGT is more sensitive than alkaline phosphatase (ALP), leucine aminopeptidase, aspartate transaminase, and alanine aminotransferase in detecting obstructive jaundice, cholangitis, and cholecystitis; its rise occurs earlier than with these other enzymes and persists longer. Only modest elevations (2-5 times normal) occur in infectious hepatitis, and in this condition, GGT determinations are less useful diagnostically than are measurements of the transaminases. High elevations of GGT are also observed in patients with either primary or secondary (metastatic) neoplasms. Elevated levels of GGT are noted not only in the sera of patients with alcoholic cirrhosis but also in the majority of sera from persons who are heavy drinkers. Studies have emphasized the value of serum GGT levels in detecting alcohol-induced liver disease. Elevated serum values are also seen in patients receiving drugs such as phenytoin and phenobarbital, and this is thought to reflect induction of new enzyme activity.

Fasting Blood Sugar (FBS)- Plasma	121	mg/dL	60.0-110.0	Hexo Kinase
-----------------------------------	-----	-------	------------	-------------

Reg. No.	: 2302240012			Report Status	: Final
C/o	: Apollo Clinic				

Test Name	Result	Unit	Reference Value	Method
-----------	--------	------	-----------------	--------

Comments: Glucose, also called dextrose, one of a group of carbohydrates known as simple sugars (monosaccharides). Glucose has the molecular formula $C_6H_{12}O_6$. It is found in fruits and honey and is the major free sugar circulating in the blood of higher animals. It is the source of energy in cell function, and the regulation of its metabolism is of great importance (fermentation; gluconeogenesis). Molecules of starch, the major energy-reserve carbohydrate of plants, consist of thousands of linear glucose units. Another major compound composed of glucose is cellulose, which is also linear. Dextrose is the molecule D-glucose. Blood sugar, or glucose, is the main sugar found in the blood. It comes from the food you eat, and it is body's main source of energy. The blood carries glucose to all of the body's cells to use for energy. Diabetes is a disease in which your blood sugar levels are too high. Usage: Glucose determinations are useful in the detection and management of Diabetes mellitus.

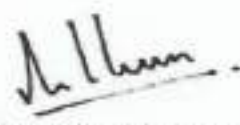

Note: Additional tests available for Diabetic control are Glycated Hemoglobin (HbA1c), Fructosamine & Microalbumin urine

Comments: Conditions which can lead to lower postprandial glucose levels as compared to fasting glucose are excessive insulin release, rapid gastric emptying & brisk glucose absorption.

Probable causes : Early Type II Diabetes / Glucose intolerance, Drugs like Salicylates, Beta blockers, Pentamidine etc., Alcohol, Dietary - Intake of excessive carbohydrates and foods with high glycemic index ? Exercise in between samples ? Family history of Diabetes, Idiopathic, Partial / Total Gastrectomy.

Comments: The kidneys help infiltration of the blood by eliminating waste out of the body through urine. They also regulate water in the body by conserving electrolytes, proteins, and other compounds. But due to some conditions and abnormalities in kidney function, the urine may encompass some abnormal constituents, which are not normally present. A complete urine examination helps in detecting such abnormal constituents in urine. Several disorders can be detected by identifying and measuring the levels of such substances. Blood cells, bilirubin, bacteria, pus cells, epithelial cells may be present in urine due to kidney disease or infection. Routine urine examination helps to diagnose kidney diseases, urinary tract infections, diabetes and other metabolic disorders.

Reg. No.	: 2302240012			Report Status	: Final
C/o	: Apollo Clinic				

Test Name	Result	Unit	Reference Value	Method
Monocytes	2.40	%	0.0-10.0	Light scattering/Manual
Basophils	0.20	%	0.0-1.0	Light scattering/Manual
Absolute Neutrophil Count	4.40	10 ³ /uL	2.0- 7.0	Calculated
Absolute Lymphocyte Count	2.48	10 ³ /uL	1.0-3.0	Calculated
Absolute Monocyte Count	0.17	10 ³ /uL	0.20-1.00	Calculated
Absolute Eosinophil Count	170.00	cells/cumm	40-440	Calculated
Absolute Basophil Count	0.01	10 ³ /uL	0.0-0.10	Calculated
Erythrocyte Sedimentation Rate (ESR)	08	mm/hr	Female : 0.0-20.0 Male : 0.0-10.0	Westergren

Peripheral Smear Examination-Whole Blood EDTA

Method: (Microscopy-Manual)

RBC'S : Normocytic Normochromic.
WBC'S : Are normal in total number, morphology and distribution.
Platelets : Adequate in number and normal in morphology.
No abnormal cells or hemoparasites are present.
Impression : Normocytic Normochromic Blood picture.

Test Name	Result	Unit	Reference Value	Method
Thyroid function tests (TFT)- Serum				
Tri-Iodo Thyronine (T3)-Serum	1.33	ng/mL	Female: 0.60 - 1.81	Chemiluminescence Immunoassay (CLIA)
Thyroxine (T4)-Serum	8.70	µg/dL	Female: 5.50 - 12.10	Chemiluminescence Immunoassay (CLIA)
Thyroid Stimulating Hormone (TSH)-Serum	4.50	µIU/mL	Female: 0.35 - 5.50	Chemiluminescence Immunoassay (CLIA)

Comments: Triiodothyronine (T3) assay is a useful test for hyperthyroidism in patients with low TSH and normal T4 levels. It is also used for the diagnosis of T3 toxicosis. It is not a reliable marker for Hypothyroidism. This test is not recommended for general screening of the population without a clinical suspicion of hyperthyroidism.

Reference range: Cord: (37 Weeks): 0.5-1.41, Children: 1-3 Days: 1.0-7.40, 1-11 Months: 1.05-2.45, 1-5 Years: 1.05-2.69, 6-10 Years: 0.94-2.41, 11-15 Years: 0.82-2.13, Adolescents (16-20 Years): 0.80-2.10

Reference range: Adults: 20-50 Years: 0.70-2.04, 50-90 Years: 0.40-1.81, Reference range in Pregnancy: First Trimester: 0.81-1.90, Second Trimester: 1.0-2.60

Increased Levels: Pregnancy, Graves disease, T3 thyrotoxicosis, TSH dependent Hyperthyroidism, increased Thyroid-binding globulin (TBG).
Decreased Levels: Nonthyroidal illness, hypothyroidism, nutritional deficiency, systemic illness, decreased Thyroid-binding globulin (TBG).

Comments: Total T4 levels offer a good index of thyroid function when TBG is normal and non-thyroidal illness is not present. This assay is useful for monitoring treatment with synthetic hormones (synthetic T3 will cause low total T4). It also helps to monitor treatment of Hyperthyroidism with Thiouracil or other anti-thyroid drugs.

Reference Range: Males: 4.6-10.5, Females: 5.5-11.0, > 60 Years: 5.0-10.70, Cord: 7.40-13.10, Children: 1-3 Days: 11.80-22.60, 1-2 Weeks: 9.90-16.60, 1-4 Months: 7.20-14.40, 1-5 Years: 7.30-15.0, 5-10 Years: 6.4-13.3

1-15 Years: 5.60-11.70, Newborn Screen: 1-5 Days: >7.5, 6 Days: >6.5
Increased Levels: Hyperthyroidism, increased TBG, familial dysalbuminemic hyperthyroxinemia, increased transthyretin, estrogen therapy, pregnancy.
Decreased Levels: Primary hypothyroidism, pituitary TSH deficiency, hypothalamic TRH deficiency, non thyroidal illness, decreased TBG.

Comments: TSH is a glycoprotein hormone secreted by the anterior pituitary. TSH is a labile hormone & is secreted in a pulsatile manner throughout the day and is subject to several non-thyroidal pituitary influences. Significant variations in TSH can occur with circadian rhythm, hormonal status, stress, sleep deprivation, caloric intake, medication & circulating antibodies. It is important to confirm any TSH abnormality in a fresh specimen drawn after ~ 3 weeks before assigning a diagnosis, as the cause of an isolated TSH abnormality.

Reference range in Pregnancy: I- trimester: 0.1-2.5; II- trimester: 0.2-3.0; III- trimester: 0.3-3.0
Reference range in Newborns: 0-4 days: 1.0-39.0; 2-20 Weeks: 1.7-9.1

Increased Levels: Primary hypothyroidism, Subclinical hypothyroidism, TSH dependent Hyperthyroidism and Thyroid hormone resistance.
Decreased Levels: Graves disease, Autonomous thyroid hormone secretion, TSH defn

Test Name	Result	Unit	Reference Value	Method
Post prandial Blood Glucose (PPBS)-Plasma	205	mg/dL	70-140	Hexo Kinase

Comments: Glucose, also called dextrose, one of a group of carbohydrates known as simple sugars (monosaccharides). Glucose has the molecular formula $C_6H_{12}O_6$. It is found in fruits and honey and is the major free sugar circulating in the blood of higher animals. It is the source of energy in cell function, and the regulation of its metabolism is of great importance (fermentation; gluconeogenesis). Molecules of starch, the major energy-reserve carbohydrate of plants, consist of thousands of linear glucose units. Another major compound composed of glucose is cellulose, which is also linear. Dextrose is the molecule D-glucose. Blood sugar, or glucose, is the main sugar found in the blood. It comes from the food you eat, and it is body's main source of energy. The blood carries glucose to all of the body's cells to use for energy. Diabetes is a disease in which your blood sugar levels are too high. Usage: Glucose determinations are useful in the detection and management of Diabetes mellitus.

Note: Additional tests available for Diabetic control are Glycated Hemoglobin (HbA1c), Fructosamine & Microalbumin urine

Comments: Conditions which can lead to lower postprandial glucose levels as compared to fasting glucose are excessive insulin release, rapid gastric emptying & brisk glucose absorption.

Probable causes : Early Type II Diabetes / Glucose intolerance, Drugs like Salicylates, Beta blockers, Pentamidine etc., Alcohol, Dietary - Intake of excessive carbohydrates and foods with high glycemic index ? Exercise in between samples ? Family history of Diabetes, Idiopathic, Partial / Total Gastrectomy.

Blood Group & Rh Typing-Whole Blood EDTA

Blood Group	O	Slide/Tube agglutination
Rh Type	Negative	Slide/Tube agglutination

Note: Confirm by tube or gel method.

Comments: ABO blood group system, the classification of human blood based on the inherited properties of red blood cells (erythrocytes) as determined by the presence or absence of the antigens A and B, which are carried on the surface of the red cells. Persons may thus have type A, type B, type O, or type AB blood.

PAP SMEAR REPORT

PAP No : 81/24

Clinical history : Health check

Specimen : 2 Conventional PAP smears.

Specimen Adequacy : Adequate for evaluation.

Description : Seen are mixture of intermediate squamous cells, superficial squamous cells and endocervical cells.

Inflammation : Neutrophilic exudate is noted.

Organism : Dodderlein bacilli are seen.

Reactive changes : Nil

Dysplastic changes : Nil

Impression : Negative for Squamous Intraepithelial Lesion/Malignancy.

Note: Enclosed: 2slides: preserve them carefully.
