Diabetic	>=126 mg/dL	>= 200 mg/dl	>= 200 mg/dl

* Fasting is defined as no caloric intake for more than 8 hours

The test should be performed as described by the WHO, using a glucose load containing the equivalent of 75 g anhydrous glucose dissolved in water.

Criteria for Diagnosis of Diabetes:

1. Fasting blood glucose (FPG) \geq 126 mg/dL
2. Two-hour blood glucose (2-h OGTT) = 200 mg/dL
3. HbA1c values (A1c) \geq 6.5%
4. Random plasma glucose \geq 200 mg/dL

(With symptoms of hyperglycemia or hyperglycemic crisis)

In the absence of unequivocal hyperglycemia, diagnosis of DM using A1C, FPG or 2-h OGTT requires two abnormal test results from the same sample or in two separate samples.

MEDI WHEEL FULL BODY ANNUAL PLUS
HbA1c (Glycosylated Hemoglobin) by HPLC

Test	Result	Unit	Biological Ref. Interval
HbA1c	5.70	%	For Screening: Diabetes: $\geq 6.5\%$; Pre-Diabetes: 5.7 - 6.4%; Non-Diabetes: $< 5.7\%$
Mean Blood Glucose	116.89	mg/dL	For Diabetic Patient: Poor Control : $> 7.0\%$; Good Control : 6.0-7.0%

Description:

- Total haemoglobin A1 c is continuously synthesized in the red blood cell through its 120 days life span. The concentration of HBA1c in the cell reflects the average blood glucose concentration it encounters.
- The level of HBA1c increases proportionately in patients with uncontrolled diabetes. It reflects the average blood glucose concentration over an extended time period and remains unaffected by short-term fluctuations in blood glucose levels.
- The measurement of HbA1c can serve as a convenient test for evaluating the adequacy of diabetic control and in preventing various diabetic complications. Because the average half life of a red blood cell is sixty days, HbA1c has been accepted as a measurement which reflects the mean daily blood glucose concentration, better than fasting blood glucose determination, and the degree of carbohydrate imbalance over the preceding two months.
- It may also provide a better index of control of the diabetic patient without resorting to glucose loading procedures.

HbA1c assay Interferences:

Erroneous values might be obtained from samples with abnormally elevated quantities of other Haemoglobins as a result of either their simultaneous elution with HbA1c (HbF) or differences in their glycation from that of HbA (HbS).
