<b>HBSAG Q</b> <i>Immunochromatography</i>	NEGATIVE	Negative	

**INTERPRETATION**

- HBsAg is the first serological marker after infection with HBV appearing one to ten weeks after exposure and two to eight weeks before the onset of clinical symptoms.

**HIV I / II**

<u>Parameters</u>	<u>Result</u>	<u>Reference Range</u>	<u>Units</u>
HIV 1 2 <i>Immunofiltration</i>	NEGATIVE	Negative	

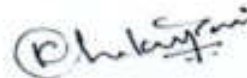

**INTERPRETATION**

Interpretation:

- 1) This is a screening test for simultaneous qualitative detection of HIV p24 antigen and antibodies to HIV type I and/or II in human serum or plasma.
- 2) A single test result is not always indicative a disease. The diagnosis of HIV infection, must be based on results of supplemental, confirmatory tests performed on repeat sample& with clinical correlation for the patient's immune status and history.
- 3) A non-reactive test does not exclude the possibility of an HIV infection. Non Reactive result implies that antibodies to HIV I/II have not been detected in the sample. This means the patient has not been exposed to HIV I/II infection or the sample has been tested during the "window phase" i.e. before the development of detectable levels of antibodies. HIV I/II detects only anti-HIV antibodies.

All reactive samples are tested by 3 different methods as per NACO guidelines, 2016.
