### INTERPRETATION

- Human hemoglobin inside erythrocytes undergoes a non enzymatic chemical reaction with glucose. The rate & extent of this reaction are thought to be dependent on the average blood glucose.
  - The ratio of HbA1c to the total HbA concentration has been suggested as a reliable measure of the degree of metabolic control in diabetic patients.
  - Lipemic and icteric samples do not interfere with the measurement of the percent HbA1c.
  - Hemoglobin F (Hb F) has the potential to interfere with the measurement of HbA1c generating falsely elevated %A1c values average blood glucose.
- N.B: All reference ranges are age and sex matched. Reference limits mentioned herein are in accordance with the literature along with the kit whi may change with the change in chemistry or the kit.  
 N.B: 1. The above result relates only to the items tested and only to the time of testing. 2. The above report cannot be reproduced in part or whole without the written permission of the chief pathologist.

TSH	4.33	uIU/ml	Adult Male - 0.27-5.50 Adult Female - 0.27-5.50 Newborns - <25 Up to 12 years - 0.3-5

Interpretations: For diagnostic purposes, the result should always be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

- The assay is unaffected by icterus (bilirubin < 20 mg/dL, or < 41 mg/dL), hemolysis (Hb < 0.621 mmol/L or < 0.5 g/dL).
- The assay is unaffected by icterus (bilirubin < 102 mmol/L, or < 28 mg/dL), biotin (< 102 nmol/L, or < 0.5 g/dL).
- There is no high dose hook effect at TSH concentrations upto 1000 pmol/L.
- TSH values may be transiently altered because of non thyroidal illness like several infections, liver disease, renal and heart failure, severe burns, trauma and surgery etc. Drugs that decrease TSH values e.g. Lithium, Amiodarone and glucocorticoids may that increase TSH values e.g. iodine, Lithium, Amiodarone.
- The assay is unaffected by icterus (bilirubin < 633 μmol/L or < 37 mg/dL), hemolysis (Hb < 1.4 mmol/L or < 2.3 g/dL), apnea (glycemia < 28.5 mmol/L or 2500 mg/dL) and biotin (< 408 nmol or < 100 ng/ml).
- The assay is unaffected by icterus (bilirubin < 599 μmol/L or < 36 mg/dL), hemolysis (Hb < 1.2 mmol/L or < 2.0 g/dL), apnea (glycemia < 1600 mg/dL) and biotin (< 123 nmol or < 30 ng/ml).
