BIOCHEMISTRY			
Investigations	Result	Unit	Biological Reference Interval
HbA1C (GLYCOSYLATED Hb)	5.6	%	-

INTERPRITATION:

Non-diabetic: < 5.7

Pre-diabetics: 5.7 - 6.4

Diabetics: > or = 6.5

ADA Target: 7.0

Action suggested: > 8.0

PLEASE CORRELATE CLINICALLY.

Interpretation(s)

GLYCOSYLATED HEMOGLOBIN, EDTA WHOLE BLOOD-Glycosylated hemoglobin (GHb) has been firmly established as an index of long-term blood glucose concentrations and

as a measure of the risk for the development of complications in patients with diabetes mellitus. Formation of GHb is essentially irreversible, and the concentration in the

blood depends on both the life span of the red blood cell (average 120 days) and the blood glucose concentration. Because the rate of formation of GHb is directly

proportional to the concentration of glucose in the blood, the GHb concentration represents the integrated values for glucose over the preceding 6-8 weeks.

Any condition that alters the life span of the red blood cells has the potential to alter the GHb level. Samples from patients with hemolytic anemias will exhibit decreased

glycated hemoglobin values due to the shortened life span of the red cells. This effect will depend upon the severity of the anemia. Samples from patients with polycythemia

or post-splenectomy may exhibit increased glycated hemoglobin values due to a somewhat longer life span of the red cells.

Glycosylated hemoglobins results from patients with HbSS, HbCC, and HbSC and HbD must be interpreted with caution, given the pathological processes, including anemia,

LDL CHOLESTROL	110.46	mg/dl	0.0-150

BLOOD SUGAR (FASTING) Methodology : GOD-POD with Serum / Plasma

BLOOD SUGAR (PP) Methodology : GOD-POD with Serum / Plasma

TOTAL CHOLESTROL

Normal < 200 mg/ dl Desirable

Border Line High 200-239 mg/dl

High > 240 mg / dl

COMMENT:-

*TRIGLYCERIDE: Level > 250 mg/dl is associated with an approximately 2 - fold greater risk of coronary vascular disease. Elevation of triglycerides can be seen with obesity, medication, fast less than 12 hrs. , alcohol intake, diabetes mellitus, and pancreatitis.

*CHOLESTEROL - Its fractions and triglycerides are the important plasma lipids in defining cardiovascular risk factors and in the management of cardiovascular disease.

*HDL- CHOLESTEROL:- LEVEL < 35 mg/dl is associated with an increased risk of coronary vascular disease even in the face of desirable levels of cholesterol and LDL - cholesterol.

*LDL - CHOLESTEROL & TOTAL CHOLESTEROL Levels can be strikingly altered by thyroid , renal and liver disease as well as hereditary factors.

IMMUNOLOGY REPORT

Registration No

SAMPLE TYPE : SERUM

IMMUNOLOGY REPORT			
Investigations	Result	Unit	Biological Reference Interval
*PSA	0.456	ng/ml	0.00 - 4.00
*T3	1.40	ng/mL	0.79 - 1.58
*T4	5.10	ug/dL	4.9 - 11.0
*TSH	3.747	µIU/ml	0.38 - 4.31

COMMENT:

Serum testing for PSA is a very important tool to screen for PROSTATE CANCER and to monitor therapy of this disease.

PSA is PROSTATE - SPECIFIC but not CANCER - SPECIFIC and apart from Prostate Cancer increased level may be found in BENIGN PROSTATE HYPERTROPHY, PROSTATITIS, INCREASING AGE, ACUTE RETENTION OF URINE, INFECTION, CATHETERISATION AND PROSTATE BIOPSY.

PSA is rarely raised in healthy man and is absent in normal women. There is no PSA present in any other normal tissue obtained from men or in patient with other CANCERS OF THE BREAST, LUNG, COLON, RECTUM, STOMACH, PANCREAS OR THYROID.

T3 & T4 : Primary malfunction of the thyroid gland may result in excessive (hyper) or below normal (hypo) release of T3 & T4. Disease in any portion of the thyroid - pituitary - hypothalamus system may influence the level of T3 & T4. T4 levels are sensitive and superior indicator of hypothyroidism. T3 levels better define hyperthyroidism, is an excellent indicator of the ability of thyroid to respond to both stimulatory and suppressive tests.

Circulating TSH levels are important in evaluating thyroid function. TSH is used in differential diagnosis of primary (thyroid) from secondary (Pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are elevated, while in secondary and tertiary hypothyroidism, TSH levels are lower in primary hyperthyroidism. T3 & T4 levels are elevated and low or undetectable TSH. TSH value between 5.6 to 10.0 indicate subclinical / mild hypothyroidism. These patients are to be treated, if thyroid antibodies ATG / TPO is positive. In negative thyroid antibodies cases TSH levels are monitored 6 monthly.

ULTRASOUND REPORT OF WHOLE ABDOMEN

Liver is normal in size and shows **grade I fatty infiltration**. No obvious focal lesion is seen in liver parenchyma. Intra hepatic biliary channels are not dilated. **Portal vein** is normal. **The CBD** is not dilated.

Gall bladder is partially distended. No e/o any obvious calculus or mass lesion is seen.

Pancreas is normal in size & echotexture with no e/o focal lesion.

Spleen is normal in size and echotexture. No focal lesion is seen.

Right Kidney is normal in size, shape & echotexture. Cortico-medullary differentiation is well maintained. No e/o calculus or hydronephrosis is seen on right side.

Left Kidney is normal in size, shape & echotexture. Cortico-medullary differentiation is well maintained. No e/o calculus or hydronephrosis is seen on left side.

Urinary bladder is well distended. The lumen is echofree with no e/o any calculus or mass lesion.

Prostate is normal in size and echo-texture with no e/o any focal lesion.

No e/o ascites or free fluid seen.

No e/o obvious abdominal lymphadenopathy is seen.

No USG e/o appendicitis is seen.

IMPRESSION : Grade I fatty liver.

Adv: clinical correlation.
