AGE / SEX	56 y / F	HOSPITAL NO.	MH013268625
ACCESSION NO.	R7184292	MODALITY	CR
REPORTED ON	05/04/2024 1:56PM	REFERRED BY	Health Check MHD

X-RAY CHEST – PA VIEW

FINDINGS:

Lung fields appear normal on both sides.
Cardia appears normal.
Both costophrenic angles appear normal.
Both domes of the diaphragm appear normal.
Bony cage appear normal.

IMPRESSION:

No significant abnormality noted.
Needs correlation with clinical findings and other investigations.

Dr. Nipun Gumber MBBS, MD DMC No.90272

BIOCHEMISTRY

Specimen: EDTA Whole blood

HbA1c (Glycosylated Hemoglobin)

9.7 # %

As per American Diabetes Association (ADA) 2010

[4.0-6.5]

HbA1c in %

Non diabetic adults : < 5.7 %

Prediabetes (At Risk) : 5.7 % - 6.4 %

Diabetic Range : > 6.5 %

Estimated Average Glucose (eAG)

232

mg/dl

Use :

1. Monitoring compliance and long-term blood glucose level control in patients with diabetes.
2. Index of diabetic control (direct relationship between poor control and development of complications).
3. Predicting development and progression of diabetic microvascular complications.

Limitations :

1. A1C values may be falsely elevated or decreased in those with chronic kidney disease.
2. False elevations may be due in part to analytical interference from carbamylated hemoglobin formed in the presence of elevated concentrations of urea, with some assays.
3. False decreases in measured A1C may occur with hemodialysis and altered red cell turnover, especially in the setting of erythropoietin treatment

HAEMATOLOGY

ERYTHROCYTE SEDIMENTATION RATE (Automated) Specimen-Whole Blood

ESR **61.0 #** **mm/1sthour** **[0.0-20.0]**

Interpretation :

Erythrocyte sedimentation rate (ESR) is a non-specific phenomena and is clinically useful in the diagnosis and monitoring of disorders associated with an increased production of acute phase reactants (e.g. pyogenic infections, inflammation and malignancies). The ESR is increased in pregnancy from about the 3rd month and returns to normal by the 4th week postpartum.

ESR is influenced by age, sex, menstrual cycle and drugs (eg. corticosteroids, contraceptives).

It is especially low (0 -1mm) in polycythemia, hypofibrinogenemia or congestive cardiac failure and when there are abnormalities of the red cells such as poikilocytosis, spherocytosis or sickle cells.

Test Name	Result	Unit	Biological Ref. Interval
COMPLETE BLOOD COUNT (EDTA Blood)			
WBC Count (Flow cytometry)	7060	/cu.mm	[4000-10000]
RBC Count (Impedence)	4.46	million/cu.mm	[3.80-4.80]
Haemoglobin (SLS Method)	11.6 #	g/dL	[12.0-15.0]
Haematocrit (PCV) (RBC Pulse Height Detector Method)	37.2	%	[36.0-46.0]
MCV (Calculated)	83.4	fL	[83.0-101.0]
MCH (Calculated)	26.0	pg	[25.0-32.0]
MCHC (Calculated)	31.2 #	g/dL	[31.5-34.5]
Platelet Count (Impedence)	304000	/cu.mm	[150000-410000]
RDW-CV (Calculated)	14.6 #	%	[11.6-14.0]
DIFFERENTIAL COUNT			
Neutrophils (Flowcytometry)	56.2	%	[40.0-80.0]
Lymphocytes (Flowcytometry)	34.1	%	[20.0-40.0]

CLINICAL PATHOLOGY

URINALYSIS--Routine urine analysis assists in screening and diagnosis of various metabolic , urological, kidney and liver disorders

Protein: Elevated proteins can be an early sign of kidney disease. Urinary protein excretion can also be temporarily elevated by strenuous exercise, orthostatic proteinuria, dehydration, urinary tract infections and acute illness with fever

Glucose: Uncontrolled diabetes mellitus can lead to presence of glucose in urine.

Other causes include pregnancy, hormonal disturbances, liver disease and certain medications.

Ketones: Uncontrolled diabetes mellitus can lead to presence of ketones in urine.

Ketones can also be seen in starvation, frequent vomiting, pregnancy and strenuous exercise.

Blood: Occult blood can occur in urine as intact erythrocytes or haemoglobin, which can occur in various urological, nephrological and bleeding disorders.

Leukocytes: An increase in leukocytes is an indication of inflammation in urinary tract or kidneys. Most Common cause is bacterial urinary tract infection.

Nitrite: Many bacteria give positive results when their number is high. Nitrite concentration during infection increases with length of time the urine specimen is retained in bladder prior to collection.

pH: The kidneys play an important role in maintaining acid base balance of the body. Conditions of the body producing acidosis/alkalosis or ingestion of certain type of food can affect the pH of urine.

Specific gravity: Specific gravity gives an indication of how concentrated the urine is. Increased Specific gravity is seen in conditions like dehydration, glycosuria and proteinuria while decrease Specific gravity is seen in excessive fluid intake, renal failure and diabetes insipidus.

Bilirubin: In certain liver diseases such as biliary obstruction or hepatitis, bilirubin gets excreted in urine.

Urobilinogen: Positive results are seen in liver diseases like hepatitis and cirrhosis and in case of hemolytic anemia.

USG WHOLE ABDOMEN

Results:

Liver is enlarged in size (~16.6 cm) and shows diffusely increased echogenicity suggestive of grade I fatty liver. No focal intra-hepatic lesion is detected. Intra-hepatic biliary radicals are not dilated. Portal vein is normal in calibre.

Gall bladder appears echofree with normal wall thickness. Common bile duct is normal in calibre.

Pancreas is normal in size and echopattern.

Spleen is normal in size (~8.3 cm) and echopattern.

Both kidneys are normal in position, size and outline. Cortico-medullary differentiation of both kidneys is maintained. Bilateral pelvicalyceal systems are not dilated. **Left kidney shows tiny concretion ~2.9 mm at middle calyx.**

Urinary bladder is normal in wall thickness with clear contents. No significant intra or extraluminal mass is seen.

Uterus is not visualized (history of hysterectomy).

Bilateral adnexal region appears unremarkable.

No significant free fluid is detected.

IMPRESSION:

- **Hepatomegaly with grade I fatty liver.**
- **Tiny concretion in left kidney.**

Kindly correlate clinically.
