 Case No. :

HBA1C-GLYCOSYLATED HAEMOGLOBIN

| Test Description | Result | Unit | Biological Reference Range |
|---------------------------------|--------|-------|--|
| HbA1c- (EDTA WB) | 5.3 | % | < 5.6 Non-diabetic 5.7-6.4 Pre-diabetic > 6.5 Diabetic |
| Estimated Average Glucose (eAG) | 105.41 | mg/dL | |
| Method : HPLC-Biorad D10-USA | | | |

INTERPRETATION

1. HbA1c is used for monitoring diabetic control. It reflects the estimated average glucose (eAG).
2. HbA1c has been endorsed by clinical groups & ADA (American Diabetes Association) guidelines 2017, for diagnosis of diabetes using a cut-off point of 6.5%.
3. Trends in HbA1c are a better indicator of diabetic control than a solitary test.
4. Low glycated haemoglobin (below 4%) in a non-diabetic individual are often associated with systemic inflammatory diseases, chronic anaemia (especially severe iron deficiency & haemolytic), chronic renal failure and liver diseases. Clinical correlation suggested.
5. To estimate the eAG from the HbA1C value, the following equation is used: $eAG(mg/dl) = 28.7 \times A1c - 46.7$
6. Interference of Haemoglobinopathies in HbA1c estimation.
 - A. For HbF > 25%, an alternate platform (Fructosamine) is recommended for testing of HbA1c.
 - B. Homozygous hemoglobinopathy is detected, fructosamine is recommended for monitoring diabetic status
 - C. Heterozygous state detected (D10/ Tosho G8 is corrected for HbS and HbC trait).
7. In known diabetic patients, following values can be considered as a tool for monitoring the glycemic control.
 - Excellent Control - 6 to 7 %,
 - Fair to Good Control - 7 to 8 %,
 - Unsatisfactory Control - 8 to 10 %
 - and Poor Control - More than 10 %.

Note : Haemoglobin electrophoresis (HPLC method) is recommended for detecting hemoglobinopathy
