Investigation: BLOOD GROUP (ABO Rh) COLLECTION

Test Name	Value	Unit	Biological Ref Interval
<b>HAEMATOLOGY</b>			
BLOOD GROUP ( ABO )	'AB'		
RH TYPING	POSITIVE		

ADVISE : BLOOD GROUP (ABO / Rh) CONFIRMATION BY BLOOD BANK.

The upper agglutination test for grouping has some limitations. It is not a confirmatory method. Before transfusion of blood, blood group must be checked & confirmed by Blood Bank. For further confirmation Reverse typing card (Dia clon ABO/D) method is suggested.

**REMARKS :**

In vitro quantitative determination of HbA1c in whole blood is utilized in long term monitoring of glycaemia. The HbA1c level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 8-12 weeks) and therefore provides much more reliable information for glycaemia monitoring than determination of blood glucose or urinary glucose.

It is recommended that the determination of HbA1c be performed at intervals of 3-6 months during diabetes mellitus therapy. Results of HbA1c should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

**Estimated average glucose (eAG) -** There is a predictable relationship between HbA1c and eAG. It helps people with diabetes to correlate their A1c to daily glucose monitoring levels. It reflects the average glucose levels in the past 2-3 months. The eAG calculation converts the A1c percentage to the same units used by glucometers mg/dl. The following table shows the relationship of eAG and A1c.

HbA1c	eAG (mg/dl)

The new recommendations for TSH levels during pregnancy are the following:

First trimester: less than 2.5 with a range of 0.1-2.5.

Second trimester: 0.2-3.0

Note : TSH levels are subject to circadian variation, reaching peak levels between 2-4 am and at a minimum 6-10 pm  
 The variation is of the order of 50%, hence time of the day has influence on the measured TSH concentrations.
