ESR - Erythrocyte Sedimentation Rate

0 - 15

mm/hr

Method: EDTA Whole Blood, Manual Westergren

### Interpretation:

- · It indicates presence and intensity of an inflammatory process. It does not diagnose a specific disease. Changes in the ESR are more significant than the abnormal results of a single test.
- · It is a prognostic test and used to monitor the course or response to treatment of diseases like tuberculosis, bacterial endocarditis, acute rheumatic fever, rheumatoid arthritis, SLE, Hodgkins disease, temporal arteritis and polymyalgia rheumatica.
- · It is also increased in pregnancy, multiple myeloma, menstruation, and hypothyroidism.
