INTERPRETATION

- 1) Human hemoglobin inside erythrocytes undergoes a non enzymatic chemical reaction with glucose. The rate & extent of this reaction are thought to be dependent on the average blood glucose.
- 2) The ratio of HbA1c to the total HbA concentration has been suggested as a reliable measure of the degree of metabolic control in diabetic patients.
- 3) Lipemic and Icteric samples do not interfere with the measurement of the percent HbA1c.
- 4) Hemoglobin F (Hb F) has the potential to interfere with the measurement of HbA1c generating falsely elevated % Alc values average blood glucose.

N.B.: All reference ranges are age and sex matched. Reference limits mentioned herein are in accordance with the literature along with the kit whi may change with the change in chemistry or the kit.

N.B.: 1. The above result relates only to the items tested and only to the time of testing.2. The above report cannot be reproduced in part or whole without the written permission of the chief pathologist.

PROSTATE SPECIFIC ANTIGEN (PSA)

PROSTATE SPECIFIC ANTIGEN (PSA) 0.66 ng/ml <3.5

Interpretation : Prostate-specific antigen (PSA) is a glycoprotein that is produced by the prostate gland, the lining of the urethra, and the bulbourethral gland. PSA exists in serum mainly in two forms, complexed to alpha-1 –anti – chymotrypsin (PSA-ACT complex) and unbound (free PSA). Increases in prostatic glandular size and tissue damage caused by benign prostatic hypertrophy, prostatitis, or prostate cancer may increase circulating PSA levels. Transient increase in PSA can also be seen following per rectal digital or sonological examinations

Interpretations:

- For diagnostic purposes, the result should always be assessed in conjunction with the patient's medical history, clinical examinations and other findings.
- The assay is unaffected by icterus (Bilirubin < 701 $\mu\text{mol/L}$ or < 41 mg/dL), hemolysis (Hb < 0.621 mmol/L or < 1 g/dL), lipemia (Intralipid < 1500 mg/dL), biotin (<102 nmol/L or < 25 ng/ml), IgG < 2 g/dL and IgM < 0.5 g/dL)
- There is no high dose hook effect at TSH concentrations upto 1000 $\mu\text{mol/ml}$.
- TSH values may be transiently altered because of non thyroidal illness like several infections, liver disease, renal and heart failure, several burns, trauma and surgery etc. Drugs that decrease TSH values e.g. L-dopa, Glucocorticoid drugs that increase TSH values e.g. Iodine, Lithium, Amiodarone.
- The assay is unaffected by icterus (bilirubin < 633 $\mu\text{mol/L}$ or < 37 mg/dl), hemolysis (Hb < 1.4 mmol/L or < 2.3 g/dl), lipemia (triglycerides < 28.5 mmol/L or 2500 mg/dl) and biotin (< 409 nmol or < 100 ng/ml).
- The assay is unaffected by icterus (bilirubin < 599 $\mu\text{mol/L}$ or < 35 mg/dl), hemolysis (Hb < 1.2 mmol/L or < 2.0 g/dl), lipemia (Intralipid < 1800 mg/dl) and biotin (< 123 nmol or < 30 ng/ml).
