**Interpretation(s)**

RBC AND PLATELET INDICES - Hematocrit index (HCT/HC) is an automated cell-counter based calculated screen test to differentiate cases of iron deficiency anaemia(>13) from iron deficiency anaemia (<13) in patients with microcytic anemia. This needs to be interpreted in line with clinical context and suspicion. Examination of smear remains the gold standard for diagnosing a case of iron deficiency anaemia. WBC DIFFERENTIAL COUNT-The optimal threshold of 3.3 for NLR showed a prognostic possibility of disease symptoms to change from mild to severe in COVID positive patients. When age = 49.5 years old and NLR = 3.3, 46.1% COVID-19 patients with mild disease might become severe. By contrast, when age < 49.5 years old and NLR < 3.3, COVID-19 patients tend to show mild disease. Reference to - The diagnostic and predictive role of NLR, d-NLR and PLR in COVID-19 patients (A-F, Tang, et al.; International Immunopharmacology 84 (2020) 108504 This score element is a calculated parameter and out of table scope.

Interpretation:

ERYTHROCYTE SEDIIMENTATION RATE (ESR), ESR-BLOOD-TEST DESCRIPTION :-

Erythrocyte sedimentation rate (ESR) is a test that indirectly measures the degree of inflammation present in the body. The test actually measures the rate of fall (sedimentation) of erythrocytes in a sample of blood that has been placed over a test, thin, vertical tube. Results are reported as the millimetres of clear fluid (plasma) that are present at the top portion of the tube after one hour. However, fully automated instruments are available to measure ESR.

ESR is not diagnostic; it is a non-specific test that may be elevated in a number of different conditions. It provides general information about the presence of an inflammatory condition. CRP is superior to ESR because it is more sensitive and reflects a more rapid change.

TEST INTERPRETATION

Increase in: Infection, Vasoitis, Inflammatory arthritis, Heart disease, Asthma, Rheumatoid arthritis and plasma cell dyscrasias, Acute allergy, Trauma (injury, Pregnancy, Surgery, medication, Aging)

Decreased in: Polycythemia vera, Sickle cell anemia

LIMITATIONS

False elevated ESR : Increased Rheumatoid Arthritis (RA), Dehydration, Hypertension, Hypothyroidism, Kidney failure, Liver disease, Multiple Myeloma, Pregnancy, Very high WBC count, Drug (Quinine, Salicylates)

--------------------	-------	---------	-------------------------------------

The strict reference range is "Fraction Hematology by Disc and Lamin, 10th edition, DICOMATED HEMOGLOBIN(HbA1C), EDTA WHOLE BLOOD- Gated Fm".

1. Evaluating the long-term control of blood glucose concentrations in diabetic patients.

2. Detecting diabetes.

3. Identifying patients at increased risk for diabetes (pre-diabetes).

The ADA recommends measurement of HbA1c (glycated Hb) 3-4 times per year for type 1 and poorly controlled type 2 diabetic patients, and 2 times per year for well-controlled type 2 diabetic patients. To determine whether a patient's metabolic control has remained consistently within the target range.

1. and (General average glucose) average percentage HbA1c to m/dl. To compare blood glucose levels.

2. and gives an evaluation of blood glucose levels for the last couple of months.

3. and is calculated as and (mg/dl) = 28.7 \* HbA1c - 46.7

**HbA1c Estimation can get affected due to :**

1. Shortened Erythrocyte survival : Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g. recovery from acute blood loss, hemolytic anemia) will falsely lower HbA1c test results. Prolongation is recommended in these patients which indicates diabetes control over 15 days.

2. Vitamin C & E are reported to falsely lower test results. (usually by adding glycine or hemoglobin.

3. Iron deficiency anemia is reported to increase test results. Hypertiglyceridemia, uremia, hyperbilirubinemia, chronic alcoholism, chronic ingestion of salicylates & opiates addition are reported to interfere with some assay methods. Falsely increasing results.

4. Interference of hemoglobinopathies in HbA1c estimation is seen in

(a) Hemoglobin hemoglobinopathy. Fructosamine is recommended for testing of HbA1c.

(b) Hemoglobin state detected (D10 is corrected for HbS & HbC only.)

(c) HbF > 25% on alternate platform (Glycoase assay chromatography) is recommended for testing of HbA1c. Abnormal hemoglobin electrophoresis (HPLC method) is recommended for detecting a hemoglobinopathy.

IMMUNOHAEMATOLOGY

ABO GROUP & RH TYPE, EDTA WHOLE BLOOD

ABO GROUP

TYPE A

METHOD : TUBE AGGLUTINATION

RH TYPE

POSITIVE

METHOD : TUBE AGGLUTINATION

**Interpretation(s)**  
ABO GROUP & RH TYPE, EDTA WHOLE BLOOD group is identified by antigens and antibodies present in the blood. Antigens are protein molecules found on the surface of red blood cells, antibodies are found in plasma. To determine blood group, red cells are mixed with different antibody solutions to give A, O or AB.  
Disclaimer: "These tests, as the results of previous ABO and Rh group (Blood Group) for pregnant women are not available, please check with the patient records for availability of the same."  
The test is performed by both forward as well as reverse grouping methods.

ECHOCARDIOGRAPHY TRANSTHORACIC

FINDINGS:

- No left ventricle regional wall motion abnormality at rest.
- Normal left ventricle systolic function, LVEF = 60%.
- Grade I left ventricle diastolic dysfunction. No e/o raised LVEDP.
- Mild mitral regurgitation.
- No aortic regurgitation. No aortic stenosis.
- Trivial tricuspid regurgitation. No pulmonary hypertension. PASP = 25 mmHg.
- Intact IVS and IAS.
- No left ventricle clot/vegetation/pericardial effusion.
- Normal right atrium and right ventricle dimension and function.
- Normal left atrium and left ventricle dimension.
- IVC measures 14 mm with normal inspiratory collapse.

DEPARTMENT OF RADIOLOGY

Date: 20/Mar/2024

X-RAY-CHEST- PA

Findings:

Both lung fields are clear.  
The cardiac shadow appears within normal limits.  
Trachea and major bronchi appears normal.  
Both costophrenic angles are well maintained.  
Bony thorax is unremarkable.

DR. YOGINI SHAH

DR. KUNAL NIGAM  
MD (Radiologist)

• Cholelithiasis without cholecystitis.

**IMPRESSION:**

No evidence of ascites.

Right ovary is normal in size and measures 2.6 x 1.6 cm. Left ovary is not seen, however left adnexa is clear.

UTERUS is normal in size & echogenicity. It measures ~ 8.0 x 4.5 x 3.6 cm. Endometrium measures 6.6 mm in thickness.

URINARY BLADDER is normal in capacity and contour. Bladder wall is normal in thickness. No evidence of intravesical mass/calculi.

PANCREAS : Head of the pancreas is unremarkable. Rest of the pancreas is obscured due to bowel gases.

Right kidney measures 11.8 x 3.5 cm. Left kidney measures 9.7 x 4.5 cm.

BOTH KIDNEYS are normal in size and echogenicity. The central sinus complex is normal. No evidence of calculi/hydronephrosis.

SPLEEN is normal in size and echogenicity.

CBD appears normal in caliber.

GALL BLADDER is physiologically distended and shows few (3-4) calculi within the lumen, largest measuring 1.1 cm. Gall bladder reveals normal wall thickness. No evidence of pericholecystic collection.

LIVER is normal in size and echogenicity. Intrahepatic portal and biliary systems are normal. No focal lesion is seen in liver. Portal vein appears normal.

DMRD, DNB. (Radiologist)

• Well defined hypoechoic lesion in left breast at 12 o'clock position of size 11 x 5 mm – most likely s/o fibroadenoma.

**Impression:**

No evidence of axillary lymphadenopathy.  
Retromammary soft tissues appear normal.  
No dilated ducts are noted.  
No evidence of solid or cystic lesion.  
Rest of the breast parenchyma appears normal.

There is a well defined hypoechoic lesion in left breast at 12 o'clock position of size 11 x 5 mm – most likely s/o fibroadenoma.

**Findings:**

**USG - BOTH BREAST**
