#### Comments:

- Disorders of Lipid metabolism play a major role in atherosclerosis and coronary heart disease.
  There is an established relationship between increased total cholesterol & LDL cholesterol and myocardial infarction.
  HDL cholesterol level is inversely related to the incidence of coronary artery disease.
- Major risk factors which adversely affect the lipid levels are:
  - 1. Cigarette smoking.
  - 2. Hypertension.
  - 3. Family history of premature coronary heart disease.
  - 4. Pre-existing coronary heart disease.

| <7.0      | Good Control  |  |  |  |  |  |

Note:

- 1.A three monthly monitoring is recommended in diabetics.
- 2. Since HbA1c concentration represents the integrated values for blood glucose over the preceding 6 10 weeks and is not affected by daily glucose fluctuation, exercise and recent food intake, it is a more useful tool for monitoring diabetics.
