Intra-hepatic vascular and biliary radicles appear normal. Portal vein and common bile duct are normal.

**GALL BLADDER:** Gall bladder is physiologically distended. The wall thickness is normal. There is no Evidence of any intraluminal mass lesion or calculi seen.

**PANCREAS:** Pancreas is normal in size, shape and echo pattern. No focal mass lesion seen. Pancreatic duct is not dilated.

**SPLEEN:** Spleen show normal in size, shape and homogeneous echopattern. No focal mass lesion is seen in parenchyma.

**KIDNEYS:** Both the kidneys are normal in size, shape, position and axis. Parenchymal echopattern is normal bilaterally. No focal solid or cystic lesion is seen. There is no evidence of renal calculi on either side.

**PARAAORTIC REGIONS:** Any mass/ lymph nodes:-- no mass or lymph nodes seen.

**URINARY BLADDER:** Adequately distended. Wall were regular and thin. Contents are Normal. No stone formation seen.

**PROSTATE:** Normal in shape and position. Parenchymal echotexture is normal. No free ascetic fluid or pleural effusion seen.

**IMPRESSION:** - Fatty liver grade 1.

### HAEMATOLOGY

	results	unit	reference
<b>ESR / ERYTHROCYTE SEDIMENTATION RATE</b>			
ESR (Erythrocyte Sedimentation Rate)	06	mm/1hr	00 - 22

#### Comments

The ESR is a simple non-specific screening test that indirectly measures the presence of inflammation in the body. It reflects the tendency of red blood cells to settle more rapidly in the face of some disease states, usually because of increases in plasma fibrinogen, immunoglobulins, and other acute-phase reaction proteins. Changes in red cell shape or numbers may also affect the ESR.

FAIR CONTROL	8-10 %
POOR CONTROL	>10 %

The Glycosylated haemoglobin assay has been validated as a reliable indicator of mean blood glucose levels for a 3 months period. AMERICAN DIABETES ASSOCIATION recommends the testing twice an year in patients with stable blood glucose, and quarterly if treatment changes or blood glucose is abnormal

#### INTERPRETATION:

Lipid profile Of lipid panel IS a panel of blood tests that serves as an initial screening tool for abnormalities in lipids, such as cholesterol and triglycerides. The results of this test can identify certain genetic diseases and can determine approximate risks for cardiovascular disease, certain forms of pancreatitis, and other diseases.

#### Comments:

Accurate measurement of glucose in body fluid is important in diagnosis and management of diabetes, hypoglycemia, adrenal dysfunction and various other conditions.

High levels of serum glucose may be seen in case of Diabetes mellitus, in patients receiving glucose containing fluids intravenously, during severe stress and in cerebrovascular accidents.

Decreased levels of glucose can be due to insulin administration, as a result of insulinoma, inborn errors of carbohydrate metabolism or fasting.

#### Comments:

Human red blood cell antigens can be divided into four groups A, B, AB AND O depending on the presence or absence of the corresponding antigens on the red blood cells. There are two glycoprotein A and B on the cell's surface that are responsible for the ABO types. Blood group is further classified as RH positive and RH negative.

Test Name	Value	Unit	Bio Ref.Interval
PSA TOTAL ,Serum EGUA	3.00	ng/mL	0.0 - 5.5

**Interpretation:**

The major site of PSA production is the glandular epithelium of the prostate. Low levels of PSA are found in the blood as a result of leakage of PSA from the prostate gland. Increasing levels of serum PSA are associated with prostatic pathology, including prostatitis, benign prostatic hyperplasia (BPH), and cancer of the prostate. Early diagnosis of carcinoma of the prostate is hindered by the lack of symptoms in man with localized tumors therefore, early detection requires a simple, safe and inexpensive test for the disease in asymptomatic man. Several studies have shown that the measurement of serum PSA concentration offers several advantages in the early detection of prostate cancer.

Serum PSA concentrations should not be interpreted as absolute evidence for the presence or absence of prostate cancer. Elevated concentration of PSA may be observed in the serum of patients with benign prostatic hyperplasia or other nonmalignant disorders as well as in prostate cancer. The PSA value should be used in conjunction with information available from clinical evaluation and other diagnostic procedures such as DRE. Some early cases of prostate cancer will not be detected by PSA testing; the same is true for DRE. Prostatic biopsy is required for the diagnosis of cancer
