General Physical Examination

Date of Examination: 03/07/2024

Name: HARDEEP SINGH Age: 32 DOB: 15/01/1991 Sex: Male

Referred By: TM FINANCIAL SERVICE LTD.

Photo ID: AADHAR CARD ID #: 00064

Ht: 163 (cm)

Wt: 56 (Kg)

Chest (Expiration): 91 (cm)

Abdomen Circumference: 78 (cm)

Blood Pressure: 90/80 mm Hg PR: 70/min RR: 18/min Temp: Afebrile

BMI 19.6

Eye Examination: R/E 7/6, N/CB
L/E 6/6, N/CB

Other: No

On examination he/she appears physically and mentally fit: Yes/No

Signature Of Examinee: [Signature]

Name of Examinee: HARDEEP SHARMA

Erythrocyte Sedimentation Rate (ESR)

Method:- Westergreen

11

mm in 1st hr

00 - 15

The erythrocyte sedimentation rate (ESR or sed rate) is a relatively simple, inexpensive, non-specific test that has been used for many years to help detect inflammation associated with conditions such as infections, cancers, and autoimmune diseases. ESR is said to be a non-specific test because an elevated result often indicates the presence of inflammation but does not tell the health practitioner exactly where the inflammation is in the body or what is causing it. An ESR can be affected by other conditions besides inflammation. For this reason, the ESR is typically used in conjunction with other tests, such as C-reactive protein. ESR is used to help diagnose certain specific inflammatory diseases, including temporal arteritis, systemic vasculitis and polymyalgia rheumatica. (For more on these, read the article on Vasculitis.) A significantly elevated ESR is one of the main test results used to support the diagnosis. This test may also be used to monitor disease activity and response to therapy in both of the above diseases as well as
