Biochemistry

HbA1C

GLYCOSYLATED HEMOGLOBIN, BLOOD

GLYCOSYLATED HEMOGLOBIN (HbA1C) 5.0 %

Non-diabetic: < 5.7

Pre-diabetics: 5.7 - 6.4

Diabetics: > or = 6.5 ADA Target: 7.0

Action suggested: > 8.0

Interpretation(s)

GLYCOSYLATED HEMOGLOBIN, BLOOD-GLYCOSYLATED HEMOGLOBIN, BLOOD

Glycation is nonenzymatic addition of sugar residue to amino groups of proteins. HbA1C is formed by the condensation of glucose with n-terminal valine residue of each beta chain of hb a to form an unstable schif base. It is the major fraction, constituting approximately 80% of HbA1.

Formation of glycated hemoglobin (GHb) is essentially irreversible and the concentration in the blood depends on both the lifespan of the red blood cells (RBC) (120 days) and the blood glucose concentration. The GHb concentration represents the integrated values for glucose over the period of 6 to 8 weeks. GHb values are free of day to day glucose fluctuations and are unaffected by recent exercise or food ingestion. Concentration of plasma glucose concentration in GHb depends on the time interval, with more recent values providing a larger contribution than earlier values.

The interpretation of GHb depends on RBC having a normal life span. Patients with hemolytic disease or other conditions with shortened RBC survival exhibit a substantial reduction of GHb. High GHb have been reported in iron deficiency anemia .

GHb has been firmly established as an index of long term blood glucose concentrations and as a measure of the risk for the development of complications in patients with diabetes mellitus. The absolute risk of retinopathy and nephropathy are directly proportional to the mean of HbA1C.

Patient Id	15098	Name	MR. SANDEEP KUMAR VAID	Accession No	-
Study Date	05/08/2024	Age	33YRS	Gender	MALE

X-RAY CHEST PA VIEW

Findings:

- Both lung fields are clear.
- Trachea and mediastinum is central.
- Cardiac size appears normal .
- Bilateral hila appears normal.
- Bilateral dome of diaphragm & costophrenic angles appear normal.
- Visualised bones & soft tissues appear normal.

Clinical correlation

Mr. Sandeep
Age :- 33Yrs /M

Date :- 05/08/2024
Refd. by: Lyf Hospital

ULTRASOUND WHOLE ABDOMEN

Liver is normal in size and echotexture. No evidence of any abscess or focal mass lesion is seen. Hepatic veins, ducts and intrahepatic biliary radicals are normal. Portal vein appears normal in size and shows antegrade flow.

Gall bladder is normally distended and shows anechoic luminal contents with normal thickness smooth walls without obvious calculus or sludge within or polyp or mass lesion or pericholecystic collection. Visualized common bile duct appears normal.

Pancreas shows normal visualized parenchyma. No focal lesion is seen. No duct dilatation or calcification is seen. No peripancreatic collection is seen.

Spleen is normal in size and reveals homogenous echotexture. No focal lesion is seen.

Both kidneys are normal in size and echotexture. Cortico-medullary differentiation is maintained. No evidence of any calculi, hydronephrosis or mass lesion is seen.

Urinary bladder is normally distended and shows anechoic luminal contents with normal thickness smooth walls without obvious mass lesion, calculus or diverticulum. Both vesico-ureteric junctions are clear.

Prostate is normal in size, shape & echotexture. No focal lesion is seen. Prostate measures 15gm.

No ascites is seen.

Both diaphragmatic excursions are normal. No evidence of any pleural effusion is seen.

IMPRESSION: No significant abnormality seen.

Suggested: Clinical correlation.
